Description

The *Cryptomeria japonica* 'Kyara gold' is a very original plant with its spiral foliage, softly variegated with green and creamy yellow colors.

Another particularity is the branches that often twist on themselves. This variety was obtained thanks to the hybridization of a *Cryptomeria japonica* Rasen's branch, so this variety keeps the same particularities, including an extra asset: the creamy yellow color of the young shoots.

Sold in a 5-liter plastic pot, the approximative height of the plant on delivery is about 100-120 cm. This variety is still little known and will bring an original touch to your garden. It can be in a full sun exposure or a half shade exposure.

The adult height of this variety will be from 4 to 5 meters and the adult width approximately 2 meters. ® variété protégée under license.
