Saxifraga fortunei beni hime

Saxifraga fortunei beni hime daimonjiso

ref. 12092 W

[+] Show on the website

Description

Strong clump of two years delivered in a 1-liter plastic pot.

Small perennial plant with thick, glossy leaves of Japanese origin. Beni hime variety with dark pink flowers blooming from mid-October to late November, depending on the variety and the onset of cold weather. The flowers resemble the shape of the kanji 'dai,' from which its name [Daimonjisô] is derived.

Abundant flowering in panicles on stems 15 to 25 centimeters tall. Inflorescence composed of 3 small oval upper petals and 2 much longer lower petals. Height ranges from 10 to 25 cm depending on the variety.

Cultivation: Requires a partially shaded to shaded location in fresh, slightly acidic, humus-rich, and well-drained soil. Do not allow water to stagnate at the base of the plant or accumulate dead leaves, as this could lead to collar rot.

Can be cultivated in a pot (in a cool room, similar to cyclamen wintering, frostfree) as a kusamono to accompany bonsai, but also in troughs, on low walls, and in open ground.

This species withstands temperatures from -15°C to -18°C in well-drained soil.

We have been successfully cultivating it for over 10 years at our nursery in Relevant.

Saxifrages lose their leaves in winter, which regrow in the spring
