Description

Observing at Maillot Bonsai for 5 years, the first signs of the corky appearance were noticed as early as the second year.
The "Super Cork" by Hubble is a new introduction of one of the finest selections of pin-bark maple by Scott Hubble of Metro Maples in Texas. This selection produces the corkiest bark among all rough-bark Japanese maple varieties to date, and does so at an earlier age. This gives 'Hubble's Super Cork' a more mature appearance from a young age. The foliage is green in summer and turns orange and then red in autumn. We expect 'Hubble's Super Cork' to reach 2 to 3 meters in 15 years. It thrives well in sunny conditions.

Due to increasing demand in Europe for collectible varieties, I am offering younger, high-quality specimens this year. These young plants, ranging from 10 to 20 cm in height, are ideal for collectors wishing to acquire plants at an early stage of development.
Please note: the plants must remain in their original pot until spring 2026. A controlled fertilizer application has already been incorporated into the substrate and will provide sufficient nutrients throughout the 2026 growing season. Carefully monitor watering, protect the plant from strong winds, and position it in partial shade to ensure optimal growing conditions.

Technical description

Species	Acer palmatum
Variety	Hubbles super cork baby
Leaf colour	Green leaves
Leaf shape	Palmated
Adult height	Between 2 and 4 meters
Shape	Natural
Exposure	Sun
